Dr. Joshua Lederberg  
Department of Genetics  
University of Wisconsin  
Madison, Wis.

Dear Dr. Lederberg:

Strains K-130 and K-93 were isolated in 1929 from cases of pyelitis and have been maintained in our laboratory since that date. No particular study has been made of these cultures other than the isolation at that time of phages active against these strains and used in attempted therapy. Strain K-201 was obtained from Dr. Gregory Schwartzman in 1945 for use in studies on the Schwartzman reaction and has not been studied otherwise by us.

Sincerely yours,

C. E. Clifton
